

Controllers?

- Controllers handle incoming HTTP requests.
- They define routes (e.g., GET, POST, PUT, DELETE).
- Bridge between client and business logic (services).

Importance of Controllers

TechZeen

- Organize API endpoints clearly and modularly.
- Help separate concerns: routing vs business logic.
- Make code scalable and maintainable.
- Improve code readability with clean structure.

Decorators?

TechZeen

- Special functions that add metadata to classes or methods.
- Start with @ symbol (e.g., @Controller(), @Get()).
- Tell NestJS how to treat the class or method.
- Used for routing, dependency injection, validation, etc.
