

# What is DTO (Data Transfer Object)?

- An object that carries data between layers (like from client to backend).
- Used to define the shape of incoming request data.
- Ensures only required data is passed (security + validation).

# What is Interface in TypeScript?

- Interfaces define the structure (type) of an object.
- Help write clean, structured, type-safe code.
- Used for both request (DTOs) and response objects.
